RawCull Installation Guide

Thank you for trying RawCull!

RawCull is an independent photography workflow app built for photographers who want a fast and smooth RAW photo culling experience.

Because RawCull is currently distributed independently and not yet signed with an Apple Developer certificate, macOS may show a security warning during installation. This is normal for many independent apps.

How to Install RawCull on macOS

1. Download the RawCull app from the official website: **https://rawcull.com**
2. Move the RawCull app into your Applications folder.
3. Double click the app to open it.
4. macOS may display a warning saying the app cannot be verified.
5. Click **Done** if the app does not open automatically.

Allow RawCull from macOS Privacy & Security

Follow these steps to allow the app manually:

1. Open **System Settings** on your Mac.
2. Go to **Privacy & Security**.
3. Scroll down until you see a message about RawCull being blocked.
4. Click **Open Anyway**.
5. Confirm by clicking **Open** when macOS asks again.
6. RawCull should now launch normally.

Important: Always download RawCull only from the official website to ensure you are installing the authentic application.

Why This Warning Appears

Apple shows this warning when an application is distributed outside the App Store and has not yet been signed with an Apple Developer account. This does not automatically mean the app is unsafe. Many independent developers distribute beta or early-stage software this way before obtaining official signing certificates.

Support RawCull Development

RawCull is being developed independently and community support helps improve the app faster.

Supporters who donate through Buy Me a Coffee can receive a **Lifetime License** for RawCull as a thank-you for supporting development.
